Defining Societal Health Needs

Royal College Definition and Guide

*Prepared with assistance from Lisa Little Consulting on behalf of the Royal College
(April, 2012)*

Introduction

The Royal College's programs and policies have long stated its intention to be responsive to societal health needs. For example, the CanMEDS Framework which was originally adopted in 1996 was explicitly developed with that purpose in mind. More recently, the Royal College's strategic plans aim to ensure that specialty medicine meets society's health needs.

There are disparate approaches to defining societal health needs in the literature and in the health system. Definitions or models may be framed around values, based on various types of social determinants, by demographic dimensions or data-based such as incidence and prevalence.

Without a clear, Royal College-specific definition, the Royal College has been hampered in setting a comprehensive, integrated approach and path for its programs and policies.

Purpose

The purpose of the Societal Health Needs definition is to provide common, cohesive and pertinent concepts, definitions and approaches to help ensure greater overall alignment of the Royal College's, policies, positions, programs and standards, and promote transparency of its decision making to various stakeholders and partners. The Guide and associated tools is designed to support the application of the definition by the various committees of the Royal College. The Council will also be better positioned to assess progress against the elements of the strategic plan that contribute to societal health needs.

Approach

The definition is derived from a literature synthesis¹ completed on the topic of 'societal health and wellness needs'. A draft definition underwent consultation within the Royal College and its various committees and was modified to reflect the feedback. The definition is subject to Council approval at its next meeting in June 2012.

The Guide, partly based on the "Social Justice Gauge tool" developed by the Canadian Nurses association¹, provides a proposed process to integrate the concept of societal health needs in all facets of Royal College work. This guide, which will be refined with use, is therefore an evergreen document. The guide contains the following:

- General Instructions: This section describes the proposed series of steps to assess policy documents and other actions to ensure they reflect societal health needs.
- Decision Aid: This assessment aid is comprised of questions, key considerations, and relevant resources for each component of the definition to help determine alignment.
- Decision Grid: The purpose of the grid is to document the observations from each part of the assessment.

¹ *Social Justice...a means to an end, an end in itself. (2nd ed.)* Canadian Nurses Association (Nov. 2010). http://www2.cna-aicc.ca/CNA/documents/pdf/publications/Social_Justice_2010_e.pdf

Definition

Societal health needs are the requirements at the individual, family, community and population levels-across the continuum of care-to achieve physical, cognitive, emotional, social and spiritual wellbeing, taking into account the broad determinants of health.

Description

The requirement for health and social services occurs within a model of health system design influenced by an ethical, economic, social, technological, geographical, multicultural, and political context where:

- ❖ “Societal” implies that health is examined at an individual, community and population level reflecting local, community and global environments. A population centered approach to need is one that:
 - embraces an epidemiological approach;
 - focuses on the needs of all individuals, communities and populations – from privileged to disadvantaged – to reduce health and social disparities and promote health and health equity;
 - embraces community orientation, engagement and involvement
- ❖ “Health” is holistically defined as a state of complete physical, cognitive, emotional, social and spiritual wellbeing and not merely the absence of disease or infirmity, within a cultural context. As such it incorporates the determinants of health.²
- ❖ “Need” is defined as the gap between a current and a desired state of being. Needs can be objective (measured) or subjective (perceived) and physical or psychological. Recognizing that needs change over time, they are identified through a collaborative process that is patient-centered, culturally sensitive, evidence-based or informed, and outcomes directed. Within the context of this approach, needs are identified by combining: information on the health status of the population, demographics and appropriate standards or levels of care.
- ❖ The continuum of care includes illness prevention and health promotion, public health, screening, diagnosis, acute care (primary, secondary, tertiary and quaternary), chronic disease management, rehabilitation, long term care, survivorship and palliative care.

² income and social status; social support networks; education employment and working conditions; social environments; physical environments; health literacy, biology and genetic attributes; epi-genetics; personal health practices and coping skills; healthy child development; racism and social exclusion; and health services. Additional Aboriginal-specific health determinants include self-determination; social capital, access to health care; cultural continuity, environmental stewardship, economic development; residential school syndrome, and colonization.

Application Guide

General Instructions

The Application Guide and its associated tools are based partly on the “Social Justice Gauge tool” developed by the Canadian Nurses Association for assessing policy documents and position papers for alignment as they advance national and international health policy and development in Canada and abroad to support global health and equity. ¹

The Application Guide will identify areas that need to be strengthened to be in better alignment with societal health needs, as well as identify existing strengths in a policy, program or specialty. The key considerations are not necessarily applicable to all situations, but rather provide a range of possible points of reflection.

The Application Guide can be used by individual members of a committee; it can also be completed in a group process by a committee as a whole.

The Application Guide involves a four-step process:

Step 1: Identify the program, policy or other ‘product’ such as practice, standard, principles, proposal, or specialty application under consideration. This may include obtaining a description and any related material.

Step 2: Consider the specific program, policy, or product in relation to each of the questions and key considerations as part of the decision aid called Assessment Alignment. This involves responding to each of the six questions. Each question includes key considerations and link to resources to further assist in the decision making process. Responses might include ideas, and facts as well as examples. When providing examples, users are encouraged to include details, values or directions, the use of particular tools or methods

Step 3: Using the second decision aid called Assessment Grid, summarize findings highlighting strengths and areas that need to be strengthened to better align the policy, program or product with the definition of social health needs.

Step 4: Make any necessary changes to the policy, program or product.

Decision Aid – Assessment Alignment

1. Does it acknowledge that the requirement for health and social services occurs within a model of health system design influenced by an ethical, economic, social, technological, geographical, multicultural, and political context?

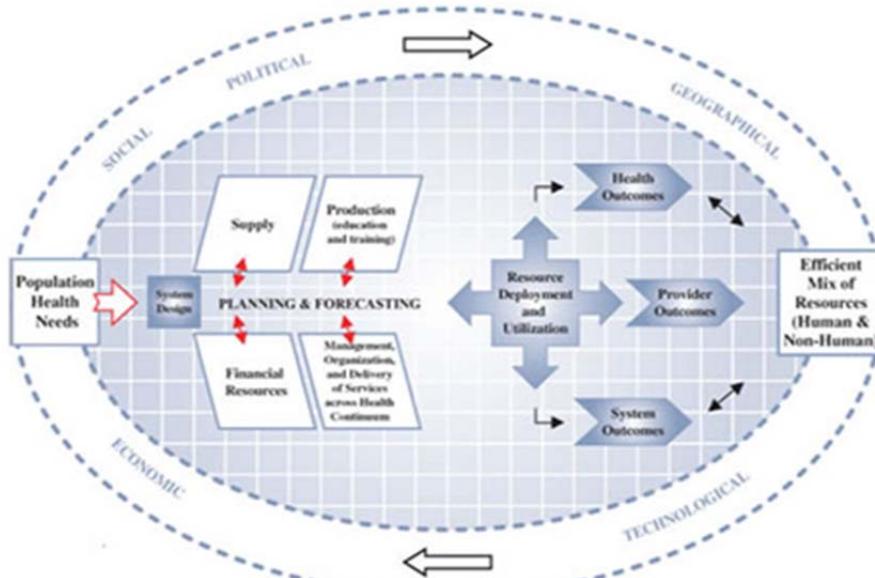

Possible Considerations:

- What are the key contextual drivers of the need for the policy, program or product?
 - Ethical considerations, i.e. end of life care
 - Economic situation , i.e. cuts to specific health programs
 - Social trends, i.e. aging population
 - Technological advances ,i.e. nanotechnology
 - Geography, i.e. urban vs rural, distribution
 - Cultural influences or differences, i.e. diabetes rates of Aboriginal people
 - Political, i.e. health goals/targets defined by provincial/territorial government

Adapted from O'Brien-Pallas, Tomblin Murphy & Birch (2005), O'Brien-Pallas, Tomblin Murphy, Birch & Baumann (2001) and O'Brien-Pallas & Baumann (1997)

2. Does it acknowledge/incorporate that health is examined at an individual, community and population level reflecting local, community and global environments?

Key Considerations:

- Is the policy, program or product applicable to an issue that is relevant to people living in specific communities, regions, across Canada or internationally?
- Does the policy, program or product incorporate an epidemiological approach?
- Does the policy, program or product identify actions to address the needs of disadvantaged populations? Of Aboriginal people?
- Does the policy, program or product include actions to address health and social disparities?
- Does the policy, program or product promote health equity?
- Does the policy, program or product embrace community orientation, engagement and involvement?

- ❖ [The Population Health Template: Key Elements and Actions That Define A Population Health Approach](#)

3. Does the policy, program or product define health holistically as a state of complete physical, mental (cognitive/emotional), social and spiritual wellbeing and not merely the absence of disease or infirmity, within a cultural context, incorporating the determinants of health?

Key Considerations:

- Is health defined holistically within the policy, program or product?
- Are the contributing determinants of health well defined?
- Are there implications relative to the cultural context? i.e. residential school syndrome for Aboriginal people

- ❖ [National Collaborating Centre for Aboriginal Health Determinants of Health Fact Sheet Series](#)

4. Does it define 'need' as the gap between a current and a desired state of being, recognizing that needs change over time, are identified through a collaborative process that is patient-centered, culturally sensitive, evidence-based or informed, and outcomes directed?

Key Considerations:

- Are the needs focused on that of the patient as opposed to the provider?
- What are the contributing factors to the needs?
- Was a cultural context applied to the definition/calculation of need?
- What is the evidence base for the definition/calculation of the need for the policy, program or product?
- Does the definition/calculation of need include a specific goal or outcome? Is it linked to national or provincial/territorial health goals or specific health outcome or system performance targets? i.e. wait time target, disease prevalence target, etc.

Resources:

- ❖ [Geographic Distribution of Physicians in Canada: Beyond How Many and Where](#)
- ❖ [Health system performance data available at the Canadian Institute for Health Information](#)

5. Does it acknowledge needs can be objective (measured) or subjective (perceived) and physical or psychological? Within the context of this approach, needs are identified by combining: information on the health status of the population, demographics and appropriate standards or levels of care.

Key Considerations:

- How is the need identified? (objective or subjective)
- What process has been taken to identify the need?
- Is the process to identify the need evidence based?
- Does it measure need over time?
- Does it show an increasing need or constant over time?
- Is this need currently able to be met by another provider?
- What is the estimated size of the population with this need?
- What is the geographic distribution of need?
- How is the health status of the target population determined?
 - i. What indicators or measures are used?
 - ii. Are there national sources of data to support the identification of need?
- Are there particular standards of care or level of care that would be core to addressing this need?
- Are there clinical practice guidelines specific to address this need?
- What would be the health outcome goals for the population expressing this need?

- ❖ [Population health data available at Statistics Canada](#)
- ❖ [Aboriginal people data available at Statistics Canada](#)
- ❖ [Population health data available at the Canadian Institute for Health Information](#)

6. Does the policy, program or product acknowledge/incorporate illness prevention and health promotion, public health, screening, diagnosis, acute care (primary, secondary, tertiary and quaternary), chronic disease management, rehabilitation, long term care, survivorship and palliative care?

Key Considerations:

- Is it applicable across the continuum of care or at least multiple practice settings? What settings specifically?
- Is there an illness prevention and health promotion component that is unique?
- Are there unique screening tools identified?
